## Product Release:

Nova Verta USA has developed a low cost energy savings device to be installed on any paint booth that not only shortens drying or curing times but also enhances the flash off capability of waterborne and solvent paints between coats or before clear coat application. The **Vortex System** can be easily installed to any type of spray booth or size in a matter of hours. The Vortex System typically reduces flash times by 50% or more and shortens curing times by 30-50% thus saving large amounts of fuel and electricity. This system has been installed on over 100 automotive and industrial spray booths in the last year with excellent customer satisfaction. Lower your carbon footprint today and contact us for an evaluation.
